

These motor-driven pallet passages are modern gate systems for modern stores.

They are electrically controlled, open quickly and reliably and, above all, save time when it comes to getting past in a forklift truck. In addition, the motor-driven pallet passage offers a secure access point that can be monitored to ensure the goods entering the facility are authorised. This helps to prevent security breaches to the facility.

Design

Upright and swivel arms made from steel tube with high-gloss chrome-plated or coloured plastic powder coated finish, or stainless steel. Pivot mechanism fully integrated in the upright, with exceptionally low risk of injury. Notice sign made of transparent acrylic glass.

Function

Opens and closes with a signal from the control panel, button or, particularly conveniently, the remote control you carry with you. This ensures access control is centralised to enhance the security of the facility.
